

STANDALONE EBPf DATAPATH

# See the network. Diagnose it. Contain it.

Netra runs its own eBPF datapath for workload flows, TCP health, DNS timing, socket identity, and leased emergency controls — independent of any CNI.

## WHAT'S RUNNING UNDER THE HOOD

|                                              |                               |                                                   |                                                     |
|----------------------------------------------|-------------------------------|---------------------------------------------------|-----------------------------------------------------|
| KERNEL PATH<br><b>eBPF · TCX / cgroup v2</b> | CNI DEPENDENCY<br><b>None</b> | ENFORCEMENT MODEL<br><b>Leased, observe-first</b> | DEPLOYMENT<br><b>Helm · one agent<br/>DaemonSet</b> |
|----------------------------------------------|-------------------------------|---------------------------------------------------|-----------------------------------------------------|

## ■ Diagnose

**Nine-stage Congestion Map**

A pictorial, cluster-wide view of exactly where the Linux network stack is under pressure — NIC ring, NAPI, IP, conntrack, TCP queues, qdisc — colored live, with per-node drill-down instead of a bare healthy/unhealthy badge.

## ■ Capture

**Live packet capture, decoded**

Wireshark-style layered decode, multi-node bulk capture, automatic pod/VM attribution by IP, saved filter presets, and JSON/CSV/pcap export — streamed straight into the dashboard, no separate tooling.

## ■ Enforce

**Controls that expire themselves**

IP, CIDR, port, UID, process, DNS-name, and TLS-SNI deny, plus rate ceilings — every one lease-governed. Enforcement reverts to observe automatically on lease expiry, agent disconnect, or controller restart.

## ■ Integrate

**AI-native, not a black box**

A 133-tool MCP server, ChatOps for Slack and Teams, heuristic-first briefs and explanations, and CEF/syslog/OTLP export into the SIEM your team already runs.
